NAIC 2026 · PROBLEM STATEMENT 01 · DEVELOPER INFRASTRUCTURE

Real-World Validation

N-ATLAS Dev Kit · Peachel Innovations · beta test on 12 October 2026 · github.com/Akindats1/natlas-devkit

Requirement: at least 2 external beta testers. **Result:** 2 external developers tested the live kit against the real N-ATLAS model; both gave written feedback and consented to be named. Everything below comes from their feedback forms and the server's usage log; nothing is estimated.

2
external testers, both consented

1–2 min
to first N-ATLAS reply (Tester 1)

3.3 s
average reply in Tester 1's logged session

2 of 2
would use it in a real project

Method

1. External developers (not part of the team) received the beta-tester guide, the shared server URL and an API key.
2. Each tester connected to the shared server (N-ATLAS on the team's GPU, exposed over HTTPS) and worked through the guide: the browser playground, a chat request in a Nigerian language, and optionally an SDK in their own code.
3. The server's anonymous usage log records every request: endpoint, client name, detected language and latency, never the message text.
4. Each tester answered the feedback form and agreed to their name and feedback being included.

Testers

#	Name	Role / organisation	Environment	Used
1	Abdul-Raheed Muhammad-Saeed	QA Engineer / Software Developer	Android 10 smartphone (Tecno Camon 40), mobile browser	Browser playground on the shared server
2	Omolaja Ma'mun	Not stated	Not stated	Shared server (".net" written in the form)

Measurements

Metric	Tester 1	Tester 2
Time from start to first N-ATLAS reply	1–2 minutes (reported)	Not stated
Requests made (server log)	5 chat requests, 12:28–12:30	Not attributed in the log
Languages tried	Yoruba, Hausa (and English)	Not stated
Speed	3.3 s average per streamed reply (server log)	"Very fast, faster than I expected" (reported)
Ease of setup	4 out of 5	"Easy"

Would use in a real project?	Yes, potentially	"Yes of course, it's very responsive, I love that"

Tester feedback

Tester 1, Abdul-Raheed Muhammad-Saeed: "The interface was simple to use on my Android phone. N-ATLAS successfully detected Yoruba and Hausa messages. It also responded appropriately to the Yoruba greeting 'Bawo ni' with 'Hello! How can I assist you today?'" On using it in a real project: "Yes, potentially. The interface is easy to access, and automatic language detection could be useful for multilingual applications. However, I would want more consistent Yoruba and Hausa understanding, better handling of spelling variations, and additional testing before using it in production."

Tester 2, Omolaja Ma'mun: What worked well: "It's very fast, [faster] than I expected." Would use it in a real project: "Yes of course, it's very responsive, I love that." What broke or confused: "Each chat shows language detected, but it can't reply in the language given to it."

Issues found and fixed during the beta

Issue reported	Status	Fix
With **Reply in: English**, Hausa "Yaya kake" got "please communicate in English" (Tester 1)	**Fixed the same day**	The reply-language prompt now tells the model it understands all four languages and names the detected input language: "(This message is in Hausa. Reply in English.)". Re-tested through the public URL: "Yaya kake" now gets "I'm doing well, thanks for asking. How are you?"
Replies did not always come back in the chosen reply language (Tester 2)	**Same fix**	Covered by the reply-language fix above; the remaining cases are the limitation below.
"Bawoni" (one word) with English forced was refused, while "Bawo ni" worked (Tester 1)	**Known limitation**	A model-level weakness with short or misspelled Yoruba and Igbo when asked to answer in another language. Documented in the README; **Auto** (reply in the user's language) avoids it, and the tester guide now recommends Auto.
Wanted clearer feedback when a language is detected but cannot be processed (Tester 1)	**Roadmap**	Noted for a future release.
Found by the team while preparing the beta: a stopped answer kept the model busy for over 120 s behind the proxy	**Fixed**	The Stop button now cancels the answer on the server (`/v1/chat/cancel/{id}`); the next request was answered in 1.1 s.

Server log evidence: Tester 1's session

Extract from the server's anonymous usage log (no message text is stored). Five streamed chat requests from the playground, all with Reply in: English, matching Tester 1's report of testing Yoruba and Hausa greetings.

Time (12 Oct 2026)	Endpoint	Detected input	Reply language	Latency
12:28:33	chat (streaming)	Yoruba	English	2.1 s
12:28:49	chat (streaming)	Yoruba	English	3.7 s
12:29:00	chat (streaming)	English	English	3.4 s
12:29:39	chat (streaming)	English	English	3.7 s
12:30:24	chat (streaming)	Hausa	English	3.7 s

The log also contains the team's own testing under other client names. Testers who open the playground as `/?tester=NAME` are now credited by name in the log.
